DEMO-FB-0001

Fictional project-intelligence brief: Northstar Beverages

By Demand Range research team · Last reviewed 3 November 2026

A fictional bottling-line and utilities expansion, created only to demonstrate the structure, caution and actionability of a Demand Range opportunity brief.

This is the project-signal side of the research model, not the required format for every account. Compare it with the fictional industry-matched and rejected account examples.

Scores, time windows, roles and actions in this brief are illustrative. They do not establish buyer access, equipment suitability or available work, and they do not authorise outreach. Named-contact delivery is not included by default.

STAGE

Design / early package definition

BUYING WINDOW

3–9 months · illustrative

SCORE

82/100 · illustrative

NEXT REVIEW

30 days · illustrative

Key facts

- This brief is fictional throughout: Northstar Beverages, its project, dates, evidence, roles and score are invented to show the format of a Demand Range project-intelligence brief.
- Its evidence trail models three public source types, a local planning record, a company careers page and an engineering contractor’s release, each with a date and a source-quality label. No real record was retrieved.
- Fact and interpretation are kept apart: the evidence table records what each invented source says, and a separate note states what the signals do not prove.

- The 82/100 score, the 3–9 month buying window and the 30-day review are illustrative. They are not a forecast or a result.

Executive thesis

Northstar Beverages appears to be preparing a brownfield bottling-line and utilities expansion. The fictional evidence indicates movement from planning and design toward equipment-package definition.

A supplier may still have time to influence hygienic transfer, valve manifold, CIP, instrumentation and utility-water choices, but the procurement route and incumbent standards remain unknown.

> FICTIONAL THROUGHOUT:
>
> *Northstar Beverages, the facility, project, dates, evidence, roles, scores and recommendations on this page do not describe a real organisation or project.*

Why it may matter

A bottling-line expansion can affect product transfer, CIP capacity, valve automation, utility water, compressed air, dosing, flow measurement and commissioning spares. Several related packages could be open; none is confirmed.

Evidence trail · fictional

DATE	FICTIONAL SOURCE	OBSERVED FACT	QUALITY
12 Jun 2026	Local planning record	Application describes a 2,800 m² production extension and new utility area.	Primary authoritative
02 Jul 2026	Company careers page	Senior project engineer role requests bottling-line and commissioning experience.	Primary commercial
21 Jul 2026	Engineering contractor release	Contractor says it was appointed to a beverage-site upgrade.	Primary commercial

Interpretation

The three invented signals are consistent with a project moving toward detailed design and mobilisation. They do not prove that pumps or valves remain unselected.

Illustrative opportunity score

DIMENSION	SCORE	RATIONALE
Product fit	27/30	Multiple plausible process and utility applications
Timing	20/25	Appears early enough; procurement date unknown
Evidence strength	17/20	Three corroborating fictional sources
Access	10/15	Roles can be mapped; decision authority unknown
Commercial value	8/10	Multi-package expansion could justify pursuit
Total	82/100	**Priority, subject to qualification**

Likely equipment relevance

- Hygienic product-transfer pumps
- CIP supply and return pumps
- Sanitary butterfly and seat valves
- Automated valve manifolds

- Flow, pressure and conductivity instrumentation
- Water and wastewater pumping
- Dosing and chemical handling
- Commissioning spares and service

Likely buying committee

ROLE	LIKELY INFLUENCE	WHAT TO LEARN
Project Engineering Lead	Scope, schedule, vendor coordination	Which packages remain open?
Process Engineer	Hygienic design and performance	Are line rate or product characteristics changing?
Utilities Manager	Water, energy, compressed air, capacity	Is utility expansion in the same capital project?
Maintenance Manager	Standardisation, reliability and spares	Which standards are already installed?
Procurement	Commercial route and tender	Is purchasing direct, via integrator or EPC?
External Integrator	Detailed design and package selection	Which items are client or vendor selected?

Known unknowns

- ⬚ Whether equipment is already specified
- ⬚ Incumbent framework agreements
- ⬚ Exact line throughput and product characteristics
- ⬚ Whether the project will be phased

- ⬚ Who owns detailed design
- ⬚ Whether packages will be tendered directly
- ⬚ Planned commissioning date
- ⬚ Which technical risk matters most

Recommended engagement plan

First action

Approach the engineering lead or appointed integrator with a technical question linked to the fictional expansion. Do not open with a catalogue.

> *"We have been reviewing the proposed production and utility expansion. On similar beverage projects, product-transfer and CIP capacity can become linked constraints. Has the team already frozen the pump and valve standard, or are those packages still being reviewed?"*

Research actions

01 Confirm the design and procurement route.

02 Identify the appointed integrator or EPC.

03 Map installed pump and valve brands.

04 Determine whether utilities and bottling are one package or separate.

05 Identify the maintenance and reliability owner.

Next review triggers

Re-score if a tender, named integrator, project appointment, revised planning document, utilities application, commissioning recruitment, construction start or supplier announcement appears.

Frequently asked questions

Is Northstar Beverages a real company?

No. Northstar Beverages, its bottling-line expansion, the dates, the evidence rows, the roles and the score are all invented. The brief exists only to show how a Demand Range project-intelligence brief is laid out, how evidence is kept apart from interpretation and how open questions are recorded before anyone acts on them.

What sources would a real project-intelligence brief use?

A real brief would use public sources such as planning records, company announcements, careers pages and contractor releases, with each factual claim linked to an accessible source and its publication and retrieval dates stored. This sample shows three of those source types, but every record in its evidence trail is invented.

What does the illustrative score of 82/100 mean?

It shows how a real brief would explain a score across product fit, timing, evidence strength, access and commercial value. In this sample every number is invented. A score is a way to rank accounts with its reasons shown; it is not a forecast that a company will buy or a measure of results.

Can I get a brief like this for my own market?

Yes, as a scoped piece of research. You tell us what you sell and which territories in Ireland, the UK and the EU matter, and we agree the sources, the review cycle and what is out of scope in writing. Named contacts are not included by default. Request a quote to start.

Demand Range output standard

A real brief would link each factual claim to an accessible approved source, store publication and retrieval dates, preserve source material or a checksum where lawful, separate fact from inference, show score rationale, identify uncertainty, record contact provenance where used and review campaign outcomes where the client supplies feedback.
